

STM8S003K3 STM8S003F3

Value line, 16 MHz STM8S 8-bit MCU, 8 Kbytes Flash, 128 bytes data EEPROM, 10-bit ADC, 3 timers, UART, SPI, I²C

Features

Core

- 16 MHz advanced STM8 core with Harvard architecture and 3-stage pipeline
- Extended instruction set

Memories

- Program memory: 8 Kbytes Flash; data retention 20 years at 55 °C after 100 cycles
- RAM: 1 Kbytes
- Data memory: 128 bytes of true data EEPROM; endurance up to 100 000 write/erase cycles

Clock, reset and supply management

- 2.95 to 5.5 V operating voltage
- Flexible clock control, 4 master clock sources:
 - Low power crystal resonator oscillator
 - External clock input
 - Internal, user-trimmable 16 MHz RC
 - Internal low power 128 kHz RC
- Clock security system with clock monitor
- Power management:
 - Low power modes (wait, active-halt, halt)
 - Switch-off peripheral clocks individually
- Permanently active, low consumption power-on and power-down reset

Interrupt management

- Nested interrupt controller with 32 interrupts
- Up to 27 external interrupts on 6 vectors

Timers

- Advanced control timer: 16-bit, 4 CAPCOM channels, 3 complementary outputs, dead-time insertion and flexible synchronization
- 16-bit general purpose timer, with 3 CAPCOM channels (IC, OC or PWM)
- 8-bit basic timer with 8-bit prescaler
- Auto wake-up timer
- Window watchdog and independent watchdog timers

Communications interfaces

- UART with clock output for synchronous operation, Smartcard, IrDA, LIN master mode
- SPI interface up to 8 Mbit/s
- I²C interface up to 400 Kbit/s

Analog to digital converter (ADC)

 10-bit, ±1 LSB ADC with up to 5 multiplexed channels, scan mode and analog watchdog

I/Os

- Up to 28 I/Os on a 32-pin package including 21 high sink outputs
- Highly robust I/O design, immune against current injection

Development support

 Embedded single wire interface module (SWIM) for fast on-chip programming and non intrusive debugging

1 Introduction

This datasheet contains the description of the device features, pinout, electrical characteristics, mechanical data and ordering information.

- For complete information on the STM8S microcontroller memory, registers and peripherals, please refer to the STM8S microcontroller family reference manual (RM0016).
- For information on programming, erasing and protection of the internal Flash memory please refer to the STM8S Flash programming manual (PM0051).
- For information on the debug and SWIM (single wire interface module) refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).
- For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

2 Description

The STM8S003x value line 8-bit microcontrollers feature 8 Kbytes Flash program memory, plus integrated true data EEPROM. The STM8S microcontroller family reference manual (RM0016) refers to devices in this family as low-density. They provide the following benefits: performance, robustness, and reduced system cost.

Device performance and robustness are ensured by integrated true data EEPROM supporting up to 100000 write/erase cycles, advanced core and peripherals made in a state-of-the art technology, a 16 MHz clock frequency, robust I/Os, independent watchdogs with separate clock source, and a clock security system.

The system cost is reduced thanks to high system integration level with internal clock oscillators, watchdog and brown-out reset.

Full documentation is offered as well as a wide choice of development tools.

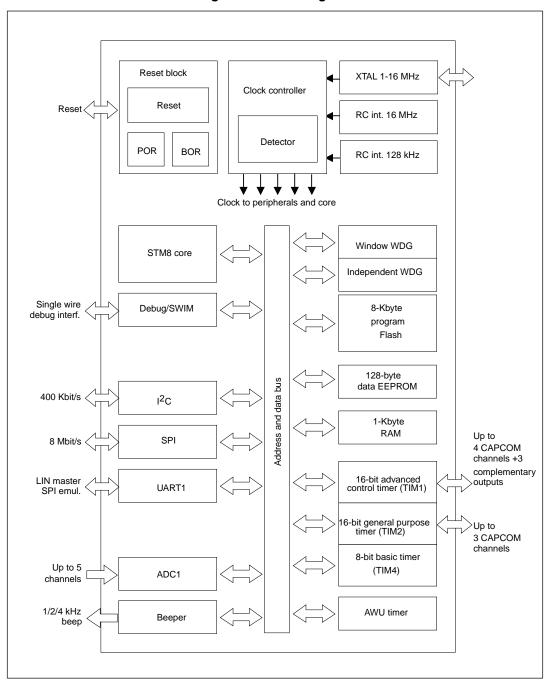

Table 1: STM8S003xx value line features

Device	STM8S003K3	STM8S003F3		
Pin count	32	20		
Maximum number of GPIOs (I/Os)	28	16		
Ext. interrupt pins	27	16		
Timer CAPCOM channels	7	7		
Timer complementary outputs	3	2		
A/D converter channels	4	5		
High sink I/Os	21	12		
Low density Flash program memory (bytes)	8K	8K		
RAM (bytes)	1K	1K		
True data EEPROM (bytes)	128 ⁽¹⁾ 128 ⁽¹⁾			
Peripheral set	Multipurpose timer (TIM1), SPI, I ² C, UART window WDG,independent WDG, ADC, PWM timer (TIM2), 8-bit timer (TIM4)			

⁽¹⁾ Without read-while-write capability.

Figure 1: Block diagram

4 Product overview

The following section intends to give an overview of the basic features of the device functional modules and peripherals.

For more detailed information please refer to the corresponding family reference manual (RM0016).

4.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus single cycle fetching for most instructions
- X and Y 16-bit index registers enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter 16-Mbyte linear memory space
- 16-bit stack pointer access to a 64 K-level stack
- 8-bit condition code register 7 condition flags for the result of the last instruction

Addressing

- 20 addressing modes
- Indexed indirect addressing mode for look-up tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

4.2 Single wire interface module (SWIM) and debug module (DM)

The single wire interface module and debug module permits non-intrusive, real-time in-circuit debugging and fast memory programming.

SWIM

Single wire interface module for direct access to the debug module and memory programming. The interface can be activated in all device operation modes. The maximum data transmission speed is 145 bytes/ms.

Debug module

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, also CPU operation can be monitored in real-time by means of shadow registers.

- R/W to RAM and peripheral registers in real-time
- R/W access to all resources by stalling the CPU
- Breakpoints on all program-memory instructions (software breakpoints)
- Two advanced breakpoints, 23 predefined configurations

4.3 Interrupt controller

- Nested interrupts with three software priority levels
- 32 interrupt vectors with hardware priority
- Up to 27 external interrupts on 6 vectors including TLI
- Trap and reset interrupts

4.4 Flash program memory and data EEPROM

- 8 Kbytes of Flash program single voltage Flash memory
- 128 bytes of true data EEPROM
- User option byte area

Write protection (WP)

Write protection of Flash program memory and data EEPROM is provided to avoid unintentional overwriting of memory that could result from a user software malfunction.

There are two levels of write protection. The first level is known as MASS (memory access security system). MASS is always enabled and protects the main Flash program memory, the data EEPROM, and the option bytes.

To perform in-application programming (IAP), this write protection can be removed by writing a MASS key sequence in a control register. This allows the application to modify the content of the main program memory and data EEPROM, or to reprogram the device option bytes.

A second level of write protection, can be enabled to further protect a specific area of memory known as UBC (user boot code). Refer to the figure below.

The size of the UBC is programmable through the UBC option byte, in increments of 1 page (64-byte block) by programming the UBC option byte in ICP mode.

This divides the program memory into two areas:

- Main program memory: 8 Kbytes minus UBC
- User-specific boot code (UBC): Configurable up to 8 Kbytes

The UBC area remains write-protected during in-application programming. This means that the MASS keys do not unlock the UBC area. It protects the memory used to store the boot

program, specific code libraries, reset and interrupt vectors, the reset routine and usually the IAP and communication routines.

Data EEPROM (128 bytes)

UBC area
Remains write protected during IAP

Low density
Flash program
memory
(8 Kbytes)

Program memory area
Write access possible for IAP

Figure 2: Flash memory organization

Read-out protection (ROP)

The read-out protection blocks reading and writing from/to the Flash program memory and the data EEPROM in ICP mode (and debug mode). Once the read-out protection is activated, any attempt to toggle its status triggers a global erase of the program memory. Even if no protection can be considered as totally unbreakable, the feature provides a very high level of protection for a general purpose microcontroller.

4.5 Clock controller

The clock controller distributes the system clock (f_{MASTER}) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

Features

- Clock prescaler: To get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- Safe clock switching: Clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- Clock management: To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- Master clock sources: Four different clock sources can be used to drive the master clock:
 - 1-16 MHz high-speed external crystal (HSE)
 - Up to 16 MHz high-speed user-external clock (HSE user-ext)
 - 16 MHz high-speed internal RC oscillator (HSI)
 - 128 kHz low-speed internal RC (LSI)

- Startup clock: After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- Clock security system (CSS): This feature can be enabled by software. If an HSE clock failure occurs, the internal RC (16 MHz/8) is automatically selected by the CSS and an interrupt can optionally be generated.
- Configurable main clock output (CCO): This outputs an external clock for use by the application.

_				5	_	- 5	
Bit	Peripheral clock						
PCKEN17	TIM1	PCKEN13	UART1	PCKEN27	Reserved	PCKEN23	ADC
PCKEN16	Reserved	PCKEN12	Reserved	PCKEN26	Reserved	PCKEN22	AWU

PCKEN14	TIM4	PCKEN10	I ² C	PCKEN24	Reserved	PCKEN20	Reserved

Table 2: Peripheral clock gating bit assignments in CLK PCKENR1/2 registers

4.6 Power management

For efficient power management, the application can be put in one of four different low-power modes. You can configure each mode to obtain the best compromise between lowest power consumption, fastest start-up time and available wakeup sources.

- Wait mode: In this mode, the CPU is stopped, but peripherals are kept running. The wakeup is performed by an internal or external interrupt or reset.
- Active halt mode with regulator on: In this mode, the CPU and peripheral clocks are stopped. An internal wakeup is generated at programmable intervals by the auto wake up unit (AWU). The main voltage regulator is kept powered on, so current consumption is higher than in active halt mode with regulator off, but the wakeup time is faster. Wakeup is triggered by the internal AWU interrupt, external interrupt or reset.
- Active halt mode with regulator off: This mode is the same as active halt with regulator on, except that the main voltage regulator is powered off, so the wake up time is slower.
- Halt mode: In this mode the microcontroller uses the least power. The CPU and peripheral
 clocks are stopped, the main voltage regulator is powered off. Wakeup is triggered by
 external event or reset.

4.7 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

Activation of the watchdog timers is controlled by option bytes or by software. Once activated, the watchdogs cannot be disabled by the user program without performing a reset.

Window watchdog timer

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

The window function can be used to trim the watchdog behavior to match the application perfectly.

The application software must refresh the counter before time-out and during a limited time window.

A reset is generated in two situations:

- 1. Timeout: At 16 MHz CPU clock the time-out period can be adjusted between 75 μ s up to 64 ms.
- 2. Refresh out of window: The downcounter is refreshed before its value is lower than the one stored in the window register.

Independent watchdog timer

The independent watchdog peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 128 kHZ LSI internal RC clock source, and thus stays active even in case of a CPU clock failure

The IWDG time base spans from 60 µs to 1 s.

4.8 Auto wakeup counter

- Used for auto wakeup from active halt mode
- Clock source: Internal 128 kHz internal low frequency RC oscillator or external clock
- LSI clock can be internally connected to TIM1 input capture channel 1 for calibration

4.9 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

The beeper output port is only available through the alternate function remap option bit AFR7.

4.10 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- Four independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Synchronization module to control the timer with external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time

- Encoder mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update, 1 x break

4.11 TIM2 - 16-bit general purpose timer

- 16-bit autoreload (AR) up-counter
- 15-bit prescaler adjustable to fixed power of 2 ratios 1...32768
- 3 individually configurable capture/compare channels
- PWM mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update

4.12 TIM4 - 8-bit basic timer

8-bit autoreload, adjustable prescaler ratio to any power of 2 from 1 to 128

Clock source: CPU clock

Interrupt source: 1 x overflow/update

Table 3: TIM timer features

Timer	Counter size (bits)	Prescaler	Counting mode	CAPCOM channels	•	Ext. trigger	Timer synchronization/ chaining
TIM1	16	Any integer from 1 to 65536	Up/down	4	3	Yes	
TIM2	16	Any power of 2 from 1 to 32768	Up	3	0	No	No
TIM4	8	Any power of 2 from 1 to 128	Up	0	0	No	

4.13 Analog-to-digital converter (ADC1)

The STM8S003xx products contain a 10-bit successive approximation A/D converter (ADC1) with up to 5 external multiplexed inputs channels and the following features:

- Input voltage range: 0 to V_{DD}
- Conversion time: 14 clock cycles
- Single and continuous and buffered continuous conversion modes
- Buffer size (n x 10 bits) where n = number of input channels
- Scan mode for single and continuous conversion of a sequence of channels
- Analog watchdog capability with programmable upper and lower thresholds
- Analog watchdog interrupt

- External trigger input
- Trigger from TIM1 TRGO
- End of conversion (EOC) interrupt

4.14 Communication interfaces

The following communication interfaces are implemented:

- UART1: Full feature UART, synchronous mode, SPI master mode, Smartcard mode, IrDA mode, single wire mode, LIN2.1 master capability
- SPI: Full and half-duplex, 8 Mbit/s
- I²C: Up to 400 Kbit/s

4.14.1 UART1

Main features

- One Mbit/s full duplex SCI
- SPI emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- LIN master mode
- Single wire half duplex mode

Asynchronous communication (UART mode)

- Full duplex communication NRZ standard format (mark/space)
- Programmable transmit and receive baud rates up to 1 Mbit/s (f_{CPU}/16) and capable of following any standard baud rate regardless of the input frequency
- Separate enable bits for transmitter and receiver
- Two receiver wakeup modes:
 - Address bit (MSB)
 - Idle line (interrupt)
- Transmission error detection with interrupt generation
- Parity control

Synchronous communication

- Full duplex synchronous transfers
- SPI master operation
- 8-bit data communication
- Maximum speed: 1 Mbit/s at 16 MHz (f_{CPU}/16)

LIN master mode

- Emission: Generates 13-bit synch break frame
- Reception: Detects 11-bit break frame

4.14.2 SPI

- Maximum speed: 8 Mbit/s (f_{MASTER}/2) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave/master selection input pin

4.14.3 I²C

- I²C master features:
 - Clock generation
 - Start and stop generation
- I2C slave features:
 - Programmable I2C address detection
 - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
 - Standard speed (up to 100 kHz)
 - Fast speed (up to 400 kHz)

⁽¹⁾ I/O pins used simultaneously for high current source/sink must be uniformly spaced around the package. In addition, the total driven current must respect the absolute maximum ratings (see *Electrical characteristics*).

5.2 STM8S003F3 TSSOP20/UFQFPN20 pinout and pin description

5.2.1 STM8S003F3 TSSOP20 pinout and pin description

Figure 4: STM8S003F3 TSSOP20 pinout

1. HS high sink capability.

⁽²⁾ When the MCU is in Halt/Active-halt mode, PA1 is automatically configured in input weak pull-up and cannot be used for waking up the device. In this mode, the output state of PA1 is not driven. It is recommended to use PA1 only in input mode if Halt/Active-halt is used in the application.

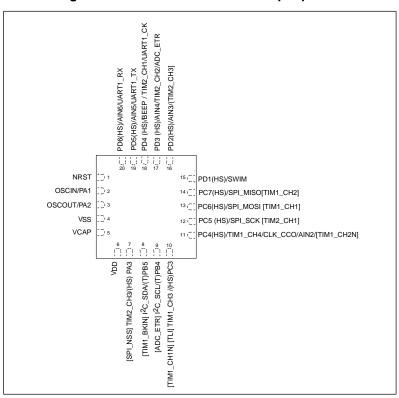

⁽³⁾In the open-drain output column, "T" defines a true open-drain I/O (P-buffer, weak pull-up, and protection diode to V_{DD} are not implemented).

⁽⁴⁾The PD1 pin is in input pull-up during the reset phase and after internal reset release.

- 2. (T) True open drain (P-buffer and protection diode to V_{DD} not implemented).
- **3.** [] alternate function remapping option (If the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).

5.2.2 STM8S003F3 UFQFPN20 pinout

Figure 5: STM8S003F3 UFQFPN20-pin pinout

- 1. HS high sink capability.
- 2. (T) True open drain (P-buffer and protection diode to V_{DD} not implemented).
- **3.** [] alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).

⁽¹⁾ I/O pins used simultaneously for high current source/sink must be uniformly spaced around the package. In addition, the total driven current must respect the absolute maximum ratings.

5.3 Alternate function remapping

As shown in the rightmost column of the pin description table, some alternate functions can be remapped at different I/O ports by programming one of eight AFR (alternate function remap) option bits. When the remapping option is active, the default alternate function is no longer available.

To use an alternate function, the corresponding peripheral must be enabled in the peripheral registers.

Alternate function remapping does not effect GPIO capabilities of the I/O ports (see the GPIO section of the family reference manual, RM0016).

⁽²⁾ When the MCU is in halt/active-halt mode, PA1 is automatically configured in input weak pull-up and cannot be used for waking up the device. In this mode, the output state of PA1 is not driven. It is recommended to use PA1 only in input mode if halt/active-halt is used in the application.

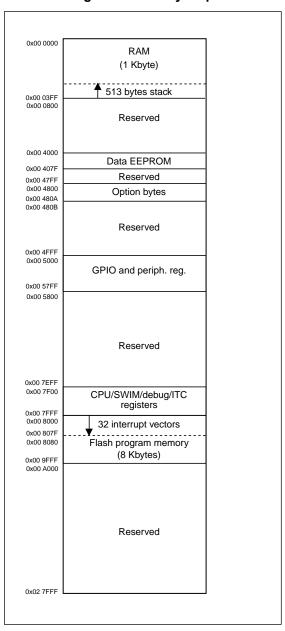

⁽³⁾ In the open-drain output column, "T" defines a true open-drain I/O (P-buffer, weak pull-up, and protection diode to V_{DD} are not implemented).

⁽⁴⁾The PD1 pin is in input pull-up during the reset phase and after internal reset release.

⁽¹⁾ Except PA1

8 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Except for the ROP (read-out protection) byte, each option byte has to be stored twice, in a regular form (OPTx) and a complemented one (NOPTx) for redundancy.

Option bytes can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in the table below.

Option bytes can also be modified 'on the fly' by the application in IAP mode, except the ROP option that can only be modified in ICP mode (via SWIM).

Refer to the STM8S Flash programming manual (PM0051) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

Option byte no.	Description
	0: No reset generated on halt if WWDG active
	1: Reset generated on halt if WWDG active
OPT4	EXTCLK: External clock selection
	0: External crystal connected to OSCIN/OSCOUT
	1: External clock signal on OSCIN
	CKAWUSEL:Auto wake-up unit/clock
	0: LSI clock source selected for AWU
	1: HSE clock with prescaler selected as clock source for for AWU
	PRSC[1:0] AWU clock prescaler
	0x: 16 MHz to 128 kHz prescaler
	10: 8 MHz to 128 kHz prescaler
	11: 4 MHz to 128 kHz prescaler
OPT5	HSECNT[7:0]:HSE crystal oscillator stabilization time
	0x00: 2048 HSE cycles
	0xB4: 128 HSE cycles
	0xD2: 8 HSE cycles
	0xE1: 0.5 HSE cycles

8.1 Alternate function remapping bits

Table 13: STM8S003K3 alternate function remapping bits for 32-pin devices

Option byte no.	Description ⁽¹⁾
OPT2	AFR7 Alternate function remapping option 7
	Reserved.
	AFR6 Alternate function remapping option 6
	0: AFR6 remapping option inactive: Default alternate function ⁽²⁾ .
	1: Port D7 alternate function = TIM1_CH4.
	AFR5 Alternate function remapping option 5
	0: AFR5 remapping option inactive: Default alternate function ⁽²⁾ .

Option byte no.	Description ⁽¹⁾
	1: Port D0 alternate function = CLK_CCO.
	AFR[4:2] Alternate function remapping options 4:2
	Reserved.
	AFR1 Alternate function remapping option 1
	0: AFR1 remapping option inactive: Default alternate functions ⁽²⁾ .
	1: Port A3 alternate function = SPI_NSS; port D2 alternate function = TIM2_CH3.
	AFR0 Alternate function remapping option 0
	Reserved.

 $^{^{(1)}}$ Do not use more than one remapping option in the same port. It is forbidden to enable both AFR1 and AFR0.

Table 14: STM8S003F3 alternate function remapping bits for 20-pin devices

Option byte no.	Description
OPT2	AFR7 Alternate function remapping option 7
	0: AFR7 remapping option inactive: Default alternate functions ⁽¹⁾ .
	1: Port C3 alternate function = TIM1_CH1N; port C4 alternate function = TIM1_CH2N.
	AFR6 Alternate function remapping option 6
	Reserved.
	AFR5 Alternate function remapping option 5
	Reserved.
	AFR4 Alternate function remapping option 4
	0: AFR4 remapping option inactive: Default alternate functions ⁽¹⁾ .
	1: Port B4 alternate function = ADC_ETR; port B5 alternate function = TIM1_BKIN.
	AFR3 Alternate function remapping option 3
	0: AFR3 remapping option inactive: Default alternate function ⁽¹⁾ .
	1: Port C3 alternate function = TLI.
	AFR2 Alternate function remapping option 2

⁽²⁾ Refer to pinout description.

Option byte no.	Description
	Reserved
	AFR1 Alternate function remapping option 1 ⁽²⁾
	0: AFR1 remapping option inactive: Default alternate functions ⁽¹⁾ .
	1: Port A3 alternate function = SPI_NSS; port D2 alternate function = TIM2_CH3.
	AFR0 Alternate function remapping option 0 ⁽²⁾
	0: AFR0 remapping option inactive: Default alternate functions ⁽¹⁾ .
	1: Port C5 alternate function = TIM2_CH1; port C6 alternate function = TIM1_CH1; port C7 alternate function = TIM1_CH2.

⁽¹⁾ Refer to pinout description.

 $^{^{(2)}}$ Do not use more than one remapping option in the same port. It is forbidden to enable both AFR1 and AFR0.

9 Electrical characteristics

9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS}.

9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100 % of the devices with an ambient temperature at $T_A = 25$ °C and $T_A = T_{Amax}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean \pm 3 Σ).

9.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25$ °C, $V_{DD} = 5$ V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean \pm 2 Σ).

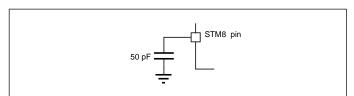

9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in the following figure.

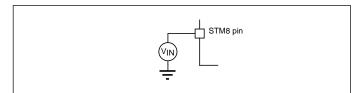

Figure 7: Pin loading conditions

9.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in the following figure.

Figure 8: Pin input voltage

9.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 15: Voltage characteristics

Symbol	Ratings	Min	Max	Unit
V _{DDx} - V _{SS}	Supply voltage ⁽¹⁾	-0.3	6.5	
V _{IN}	Input voltage on true open drain pins ⁽²⁾	V _{SS} - 0.3	6.5	V
	Input voltage on any other pin ⁽²⁾	V _{SS} - 0.3	V _{DD} + 0.3	
V _{DDx} - V _{DD}	Variations between different power pins		50	
V _{SSx} - V _{SS}	Variations between all the different ground pins	round 50 mV		mV
V _{ESD}	Electrostatic discharge voltage	See "Absolute maximum ratings (electrical sensitivity)"		

⁽¹⁾ All power (V_{DD}) and ground (V_{SS}) pins must always be connected to the external power supply

Table 16: Current characteristics

Symbol	Ratings	Max ⁽¹⁾	Unit
I _{VDD}	Total current into V _{DD} power lines (source) ⁽²⁾	100	mA

 $^{^{(2)}}$ $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

Symbol	Ratings	Max ⁽¹⁾	Unit
I _{VSS}	Total current out of V _{SS} ground lines (sink) ⁽²⁾	80	
I _{IO}	Output current sunk by any I/O and control pin	20	
	Output current source by any I/Os and control pin	- 20	
I _{INJ(PIN)} (3) (4)	Injected current on NRST pin	± 4	
	Injected current on OSCIN pin	± 4	
	Injected current on any other pin ⁽⁵⁾	± 4	
ΣΙ _{INJ(PIN)} ⁽³⁾	Total injected current (sum of all I/O and control pins) ⁽⁵⁾	± 20	

⁽¹⁾ Data based on characterization results, not tested in production.

Table 17: Thermal characteristics

Symbol	Ratings	Value	Unit
T _{STG}	Storage temperature range	-65 to +150	°C
T _J	Maximum junction temperature	150	

⁽²⁾ All power (V_{DD}) and ground (V_{SS}) pins must always be connected to the external supply.

 $^{^{(3)}}$ $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

 $^{^{(4)}}$ ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{\text{INJ}(\text{PIN})}$ and $\Sigma I_{\text{INJ}(\text{PIN})}$ in the I/O port pin characteristics section does not affect the ADC accuracy.

When several inputs are submitted to a current injection, the maximum $\Sigma I_{\text{INJ(PIN)}}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{\text{INJ(PIN)}}$ maximum current injection on four I/O port pins of the device.

9.3 Operating conditions

Table 18: General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f _{CPU}	Internal CPU clock frequency		0	16	MHz
V _{DD}	Standard operating voltage		2.95	5.5	V
VCAP ⁽¹⁾	C _{EXT} : capacitance of external capacitor		470	3300	nF
	ESR of external capacitor	at 1 MHz ⁽²⁾	-	0.3	Ω
	ESL of external capacitor		-	15	nΗ
P _D ⁽³⁾	Power dissipation at T _A = 85 °C	TSSOP20	-	238	
	for suffix 6	UFQFPN20	-	220	mW
		LQFP32	-	330	
T _A	Ambient temperature for 6 suffix version	Maximum power dissipation	-40	85	°C
T _J	Junction temperature range for suffix 6		-40	105	

⁽¹⁾Care should be taken when selecting the capacitor, due to its tolerance, as well as the parameter dependency on temperature, DC bias and frequency in addition to other factors. The parameter maximum value must be respected for the full application range.

⁽²⁾This frequency of 1 MHz as a condition for VCAP parameters is given by design of internal regulator.

 $^{^{(3)}}$ To calculate $P_{Dmax}(T_A)$, use the formula $P_{Dmax} = (T_{Jmax} - T_A)/\Theta_{JA}$ (see *Thermal characteristics*) with the value for T_{Jmax} given in the previous table and the value for Θ_{JA} given in *Thermal characteristics*.

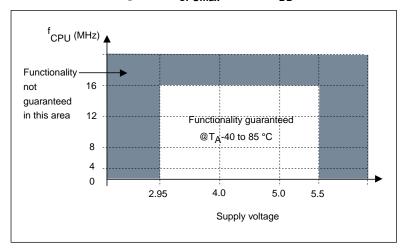

Figure 9: f_{CPUmax} versus V_{DD}

Table 19: Operating conditions at power-up/power-down

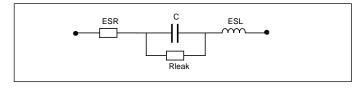

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
	V _{DD} rise time rate		2		8	uc/\/
t _{VDD}	V _{DD} fall time rate ⁽¹⁾		2		8	µs/V
t _{TEMP}	Reset release delay	V _{DD} rising			1.7	ms
V _{IT+}	Power-on reset threshold		2.6	2.7	2.85	V
V _{IT-}	Brown-out reset threshold		2.5	2.65	2.8	v
V _{HYS(BOR)}	Brown-out reset hysteresis			70		mV

⁽¹⁾ Reset is always generated after a t_{TEMP} delay. The application must ensure that V_{DD} is still above the minimum opperating voltage (V_{DD} min) when the t_{TEMP} delay has elapsed.

9.3.1 VCAP external capacitor

Stabilization for the main regulator is achieved connecting an external capacitor C_{EXT} to the V_{CAP} pin. C_{EXT} is specified in the Operating conditions section. Care should be taken to limit the series inductance to less than 15 nH.

Figure 10: External capacitor C_{EXT}

1. ESR is the equivalent series resistance and ESL is the equivalent inductance.

9.3.2 Supply current characteristics

The current consumption is measured as described in *Pin input voltage*.

9.3.2.1 Total current consumption in run mode

The MCU is placed under the following conditions:

- $\bullet~$ All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled (clock stopped by peripheral clock gating registers) except if explicitly mentioned.

Subject to general operating conditions for V_{DD} and T_A .

Table 20: Total current consumption with code execution in run mode at V_{DD} = 5 V

Symbol	Parameter	Conditions		Тур	Max ⁽¹⁾	Unit
		f _{CPU} = f _{MASTER} =	HSE crystal osc. (16 MHz)	2.3		
		16 MHz	HSE user ext. clock (16 MHz)	2	2.35	
			HSI RC osc. (16 MHz)	1.7	2	
in run mode, code executed from RAM $f_{CPU} = f_{MASTER}$	$f_{CPU} = f_{MASTER}/128 =$	HSE user ext. clock (16 MHz)	0.86			
	· ·	125 kHz	HSI RC osc. (16 MHz)	0.7	0.87	
I _{DD(RUN)}	from RAM	f _{CPU} = f _{MASTER} /128 = 15.625 kHz	HSI RC osc. (16 MHz/8)	0.46	0.58	mA
		f _{CPU} = f _{MASTER} = 128 kHz	LSI RC osc. (128 kHz)	0.41	0.55	
	Supply current	f -f -	HSE crystal osc. (16 MHz)	4.5

I _{DD(ADC1)}	ADC1 supply current when converting ⁽³⁾	1000	

⁽⁶⁾ Plus 1 LSI clock depending on synchronization.

⁽²⁾ Characterized with all I/Os tied to V_{SS}.

- $^{(1)}$ Data based on a differential I_{DD} measurement between reset configuration and timer counter running at 16 MHz. No IC/OC programmed (no I/O pads toggling). Not tested in production.
- $^{(2)}$ Data based on a differential I_{DD} measurement between the on-chip peripheral when kept under reset and not clocked and the on-chip peripheral when clocked and not kept under reset. No I/O pads toggling. Not tested in production.
- $^{(3)}$ Data based on a differential I_{DD} measurement between reset configuration and continuous A/D conversions. Not tested in production.

9.3.2.8 Current consumption curves

The following figures show typical current consumption measured with code executing in RAM.

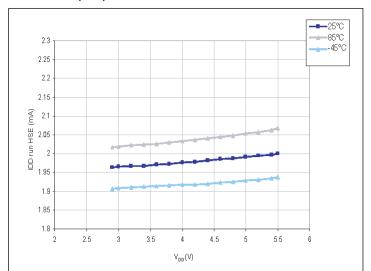

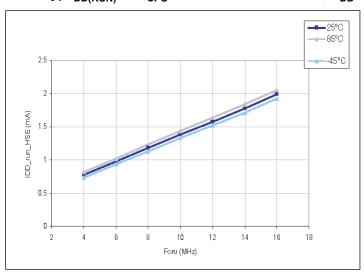

Figure 11: Typ $I_{DD(RUN)}$ vs. V_{DD} HSE user external clock, f_{CPU} = 16 MHz

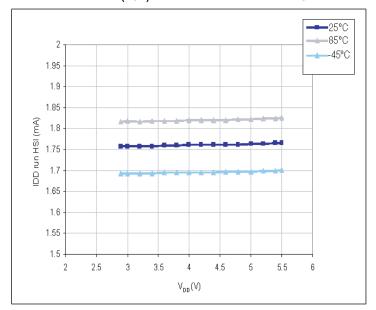

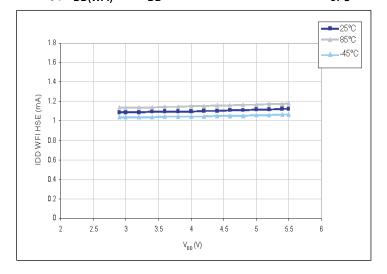

Figure 13: Typ $I_{DD(RUN)}$ vs. V_{DD} HSI RC osc, f_{CPU} = 16 MHz

Figure 14: Typ $I_{DD(WFI)}$ vs. V_{DD} HSE user external clock, f_{CPU} = 16 MHz

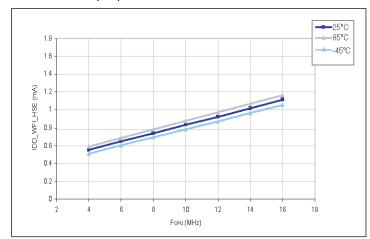

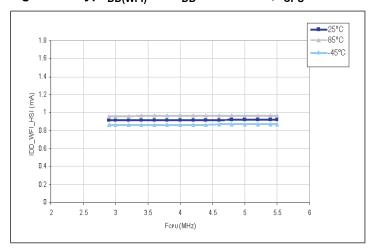

Figure 15: Typ $I_{DD(WFI)}$ vs. f_{CPU} HSE user external clock, V_{DD} = 5 V

9.3.3 External clock sources and timing characteristics

HSE user external clock

Subject to general operating conditions for V_{DD} and $T_{A}. \label{eq:conditions}$

Table 31: HSE user external clock characteristics

Symbol	Parameter	Conditions	Min	Мах	Unit
f _{HSE_ext}	User external clock source frequency		0	16	N⁄a±
V _{HSEH} (1)	OSCIN input pin high level voltage		0.7 x V _{DD}	V _{DD} + 0.3 V	V
V _{HSEL} ⁽¹⁾	OSCIN input pin low level voltage		V_{SS}	0.3 x V _{DD}	
I _{LEAK_HSE}	OSCIN input leakage current	V _{SS} < V _{IN} < V _{DD}	-1	+1	μA

⁽¹⁾ Data based on characterization results, not tested in production.

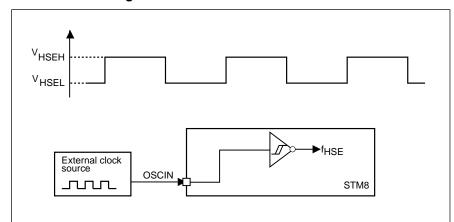

Figure 17: HSE external clock source

HSE crystal/ceramic resonator oscillator

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and start-up stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
f _{HSE}	External high speed oscillator frequency		1		16	MHz
R _F	Feedback resistor			220		kΩ
C ⁽¹⁾	Recommended load capacitance ⁽²⁾				20	pF
I _{DD(HSE)}	HSE oscillator power consumption	C = 20 pF, f _{OSC} = 16 MHz			6 (startup) 1.6 (stabilized) ⁽³⁾	· mA
		C = 10 pF, f _{OSC} =16 MHz			6 (startup) 1.2 (stabilized) ⁽³⁾	
g _m	Oscillator transconductance		5			mA/V
t _{SU(HSE)} (4)	Startup time	V _{DD} is stabilized		1		ms

Table 32: HSE oscillator characteristics

- (1) C is approximately equivalent to 2 x crystal Cload.
- $^{(2)}$ The oscillator selection can be optimized in terms of supply current using a high quality resonator with small R_m value. Refer to crystal manufacturer for more details
- (3) Data based on characterization results, not tested in production.
- ⁽⁴⁾ t_{SU(HSE)} is the start-up time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

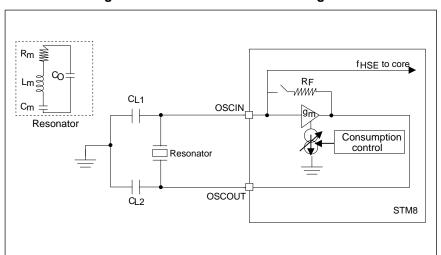

Figure 18: HSE oscillator circuit diagram

HSE oscillator critical g $_{\rm m}$ equation

$$g_{mcrit} = (2 \times \Pi \times f_{HSE})^2 \times R_m (2Co + C)^2$$

R_m: Notional resistance (see crystal specification)

L_m: Notional inductance (see crystal specification)

C_m: Notional capacitance (see crystal specification)

Co: Shunt capacitance (see crystal specification)

 $C_{1,1}$ = $C_{1,2}$ = C: Grounded external capacitance

 $g_m >> g_{mcrit}$

9.3.4 Internal clock sources and timing characteristics

Subject to general operating conditions for V_{DD} and T_{A} .

High speed internal RC oscillator (HSI)

Table 33: HSI oscillator characteristics

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
f _{HSI}	Frequency			16		MHz

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
ACC _{HSI}	Accuracy of HSI oscillator	User-trimmed with CLK_HSITRIMR register for given V _{DD} and T _A conditions ⁽¹⁾			1.0 ⁽³⁾	%
	Accuracy of HSI oscillator (factory calibrated)	$V_{DD} = 5 \text{ V},$ -40 °C ≤ $T_A \le 85 \text{ °C}$	-5		5	
t _{su(HSI)}	HSI oscillator wakeup time including calibration				1.0 ⁽³⁾	μs
I _{DD(HSI)}	HSI oscillator power consumption			170	250 ⁽²⁾	μΑ

⁽¹⁾ Refer to application note.

⁽³⁾ Guaranteed by design, not tested in production.

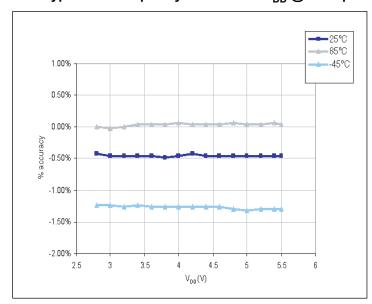

Figure 19: Typical HSI frequency variation vs $V_{\rm DD}$ @ 4 temperatures

 $^{^{\}left(2\right) }$ Data based on characterization results, not tested in production.

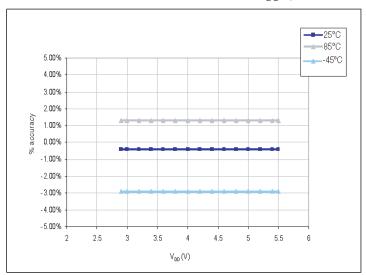

Low speed internal RC oscillator (LSI)

Subject to general operating conditions for V_{DD} and $\mathrm{T}_{\mathrm{A}}.$

Table 34: LSI oscillator characteristics

Symbol	Parameter	Тур	Max	Unit
f_{LSI}	Frequency	128		kHz
t _{su(LSI)}	LSI oscillator wake-up time		7	μs
I _{DD(LSI)}	LSI oscillator power consumption	5		μΑ

Figure 20: Typical LSI frequency variation vs V_{DD} @ 4 temperatures

9.3.5 Memory characteristics

RAM and hardware registers

Table 35: RAM and hardware registers

Symbol	Parameter	Conditions	Min	Unit
V _{RM}	Data retention mode	Halt mode (or reset)	V _{IT-max}	٧

⁽¹⁾ Minimum supply voltage without losing data stored in RAM (in halt mode or under reset) or in hardware registers (only in halt mode). Guaranteed by design, not tested in production.

 $^{^{(2)}}$ Refer to the Operating conditions section for the value of $\rm V_{IT\text{-}max}$

Flash program memory and data EEPROM

Table 36: Flash program memory and data EEPROM

Symbol	Parameter	Conditions	Min (1)	Тур	Мах	Unit
V _{DD}	Operating voltage (all modes, execution/ write/erase)	f _{CPU} ≤ 16 MHz	2.95		5.5	V
t _{prog}	Standard programming time (including erase) for byte/word/block (1 byte/ 4 bytes/64 bytes)			6	6.6	
	Fast programming time for 1 block (64 bytes)			3	3.33	ms
t _{erase}	Erase time for 1 block (64 bytes)			3	3.33	
N _{RW}	Erase/write cycles ⁽²⁾ (program memory)	- T _A = 85 °C	100			avalas
	Erase/write cycles ⁽²⁾ (data memory)		100 k		Cycle	cycles
t _{RET}	Data retention (program memory) after 100 erase/write cycles at T _A = 85 °C	- T _{RET} = 55°C	20			
	Data retention (data memory) after 10 k erase/write cycles at T _A = 85 °C		20			years
	Data retention (data memory) after 100 k erase/write cycles at T _A = 85 °C	T _{RET} = 85°C	1			
I _{DD}	Supply current (Flash programming or erasing for 1 to 128 bytes)			2		mA

9.3.6 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 37: I/O static characteristics

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
V _{IL}	Input low level voltage	V _{DD} = 5 V	-0.3 V		0.3 x V _{DD}	V
V _{IH}	Input high level voltage		0.7 x V _{DD}		V _{DD} + 0.3	v
V _{hys}	Hysteresis ⁽¹⁾			700		mV
R _{pu}	Pull-up resistor	V_{DD} = 5 V, V_{IN} = V_{SS}	30	55	80	kΩ
t _R , t _F	Rise and fall time (10 % - 90 %)	Fast I/Os Load = 50 pF			20 ⁽²⁾	
		Standard and high sink I/Os Load = 50 pF			125 ⁽²⁾	ns
I _{lkg}	Digital input leakage current	$V_{SS} \le V_{IN} \le V_{DD}$			±1 ⁽²⁾	μΑ
I _{Ikg ana}	Analog input leakage current	$V_{SS} \le V_{IN} \le V_{DD}$			±250 ⁽²⁾	nA
I _{lkg(inj)}	Leakage current in adjacent I/O	Injection current ±4 mA			±1 ⁽²⁾	μА

⁽¹⁾ Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested in production.

⁽¹⁾ Data based on characterization results, not tested in production.

⁽²⁾ The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.

⁽²⁾Data based on characterisation results, not tested in production.

t _{IN FP(NRST)}	NRST input not filtered pulse ⁽³⁾		500			1115
t _{OP(NRST)}	NRST output pulse (3)		20			μs

⁽¹⁾ Data based on characterization results, not tested in production.

 $^{^{(2)}}$ The R_{PU} pull-up equivalent resistor is based on a resistive transistor

⁽³⁾ Data guaranteed by design, not tested in production.

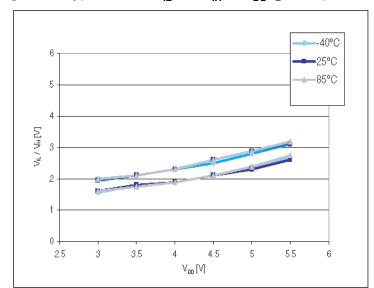

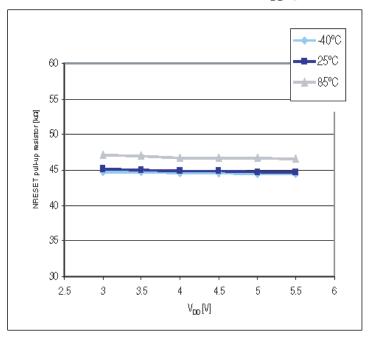

Figure 34: Typical NRST $\rm V_{IL}$ and $\rm V_{IH}$ vs $\rm V_{DD}$ @ 4 temperatures

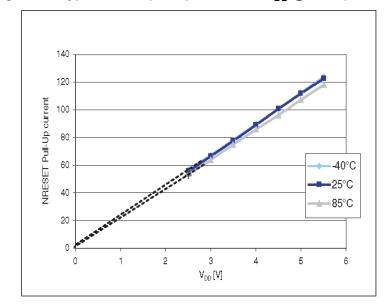

Figure 36: Typical NRST pull-up current vs V_{DD} @ 4 temperatures

The reset network shown in the following figure protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below $V_{\rm IL(NRST)}$ max. (see $\#unique_55/CD662$), otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If NRST signal is used to reset external circuitry, attention must be taken to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. Minimum recommended capacity is 10 nF.

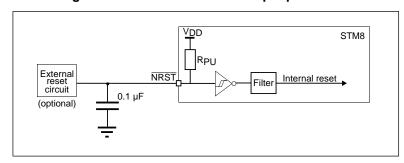

Figure 37: Recommended reset pin protection

9.3.8 SPI serial peripheral interface

Unless otherwise specified, the parameters given in the following table are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions. $t_{MASTER} = 1/f_{MASTER}$.

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 42: SPI characteristics

	10-bit resolution)	f _{ADC} = 6 MHz	2.33			μs
			14			1/f _{ADC}

⁽¹⁾ During the sample time the input capacitance C_{AIN} (3 pF max) can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within $t_{S.}$ After the end of the sample time t_{S} , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{S} depend on programming.

9.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

9.3.11.1 Functional EMS (electromagnetic susceptibility)

While executing a simple application (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- FESD: Functional electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000-4-2 standard.
- FTB: A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709 (EMC design guide for STMicrocontrollers).

9.3.11.2 Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and pregualification tests in relation with the EMC level requested for his application.

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be recovered by applying a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring. See application note AN1015 (Software techniques for improving microcontroller EMC performance).

Conditions Level/ Symbol Parameter class Voltage limits to be V_{FESD} applied on any I/O pin to V_{DD} = 3.3 V, T_{A} = 25 °C, f_{MASTER} = 16 MHz (HSI clock), conforming to IEC 61000-4-2 2/B (1) induce a functional disturbance Fast transient voltage V_{EFTB} burst limits to be applied V_{DD} = 3.3 V, T_{A} = 25 °C , f_{MASTER} = 16 MHz (HSI clock),conforming to IEC 61000-4-4 4/A (1) through 100 pF on V_{DD}

Table 47: EMS data

9.3.11.3 Electromagnetic interference (EMI)

and V_{SS} pins to induce a functional disturbance

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm SAE IEC 61967-2 which specifies the board and the loading of each pin.

Conditions Max f_{HSE}/f_{CPU} ⁽¹⁾ Unit Symbol **Parameter** General Monitored conditions 16 MHz/ 16 MHz/ frequency band 8 MHz 16 MHz Peak level $V_{DD} = 5 V$ 0.1 MHz to 5 5 $T_A = 25 \,^{\circ}C$ 30 MHz S_{EMI} dBµV LQFP32 package 4 5 30 MHz to

9.3.11.4 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, DLU and LU) using specific measurement methods, the product is stressed to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

9.3.11.5 Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). One model can be simulated: Human body model. This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

Table 49: ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value ⁽¹⁾	Unit
V _{ESD(HBM)}	Electrostatic discharge voltage (Human body model)	T _A = 25°C, conforming to JESD22-A114	A	4000	V
V _{ESD(CDM)}	Electrostatic discharge voltage (Charge device model)	T _A LQFP32 package = 25°C, conforming to SD22-C101	IV	1000	v

⁽¹⁾ Data based on characterization results, not tested in production

9.3.11.6 Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance:

- A supply overvoltage (applied to each power supply pin)
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 50: Electrical sensitivities

Symbol	Parameter	Conditions	Class ⁽¹⁾
LU	Static latch-up class	T _A = 25 °C	А
		T _A = 85 °C	А

⁽¹⁾ Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

10 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

11 Thermal characteristics

The maximum chip junction temperature $(T_{J max})$ must never exceed the values given in *Operating conditions*.

The maximum chip-junction temperature, T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{\text{Jmax}} = T_{\text{Amax}} + (P_{\text{Dmax}} \times \Theta_{\text{JA}})$$

Where

- T_{Amax} is the maximum ambient temperature in °C
- ullet Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and P_{I/Omax} (PDmax = P_{INTmax} + P_{I/Omax})
- P_{INTmax} is the product of I_{DD} and V_{DD}, expressed in Watts. This is the maximum chip internal power.
- P_{I/Omax} represents the maximum power dissipation on output pins

Where: $P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma ((V_{DD} - V_{OH}) * I_{OH})$, taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.

Parameter⁽¹⁾ Symbol Value Unit Thermal resistance junction-ambient 84 °C/W Θ_{JA} TSSOP20 - 4.4 mm 90 Thermal resistance junction-ambient Θ_{JA} UFQFPN20 - 3 x 3 mm 60 Θ_{JA} Thermal resistance junction-ambient LQFP32 - 7 x 7 mm

Table 54: Thermal characteristics

11.1 Reference document

JESD51-2 integrated circuits thermal test method environment conditions - natural convection (still air). Available from www.jedec.org.

11.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code.

⁽¹⁾Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

- Maximum ambient temperature T_{Amax}= 75 °C (measured according to JESD51-2)
- $I_{DDmax} = 8 \text{ mA}, V_{DD} = 5 \text{ V}$
- Maximum 20 I/Os used at the same time in output at low level with

$$I_{OL}$$
 = 8 mA, V_{OL} = 0.4 V

 $P_{INTmax} = 8 \text{ mA } x 5 \text{ V} = 400 \text{ mW}$

Amax

P_{Dmax} = 400 _{mW +} 64 mW

Thus: P_{Dmax} = 464 mW

 T_{Jmax} for LQFP32 can be calculated as follows, using the thermal resistance Θ_{JA} :

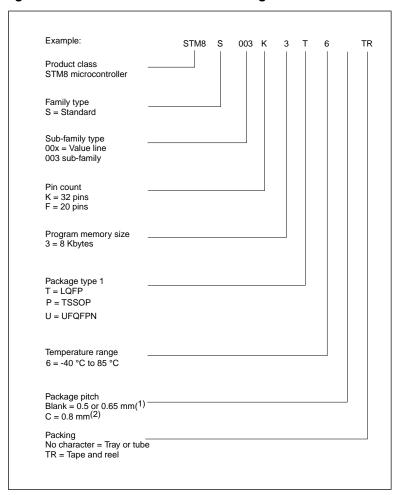

$$T_{Jmax}$$
 = 75 °C + (60 °C/W x 464 mW) = 75 °C + 27.8 °C = 102.8 °C

This is within the range of the suffix 6 version parts (-40 < T_J < 105 °C).

In this case, parts must be ordered at least with the temperature range suffix 6.

12 Ordering information

Figure 47: STM8S003x value line ordering information scheme

- 2. LQFP package.

For a list of available options (e.g. package, packing) and orderable part numbers or for further information on any aspect of this device, please go to *www.st.com* or contact the ST Sales Office nearest to you.

13 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STice emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

13.1 Emulation and in-circuit debugging tools

The STice emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STice offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet your development requirements and to adapt your emulation system to support existing and future ST microcontrollers.

STice key features

- Occurrence and time profiling and code coverage (new features)
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Program and data trace recording up to 128 KB records
- Read/write on the fly of memory during emulation
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows you to specify the components you need to meet your development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

13.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST Visual Develop (STVD) IDE and the ST Visual Programmer (STVP) software interface. STVD provides seamless integration of the Cosmic and Raisonance C compilers for STM8, which are available in a free version that outputs up to 16 Kbytes of code.

13.2.1 STM8 toolset

STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at www.st.com/mcu. This package includes:

ST Visual Develop - Full-featured integrated development environment from ST, featuring

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STice such as code profiling and coverage

ST Visual Programmer (STVP) – Easy-to-use, unlimited graphical interface allowing read, write and verify of your STM8 microcontroller's Flash program memory, data EEPROM and option bytes. STVP also offers project mode for saving programming configurations and automating programming sequences.

13.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of your application directly from an easy-to-use graphical interface.

Available toolchains include:

- Cosmic C compiler for STM8 Available in a free version that outputs up to 16 Kbytes of code. For more information, see www.cosmic-software.com.
- Raisonance C compiler for STM8 Available in a free version that outputs up to 16 Kbytes of code. For more information, see www.raisonance.com.
- STM8 assembler linker Free assembly toolchain included in the STVD toolset, which allows you to assemble and link your application source code.

13.3 Programming tools

During the development cycle, STice provides in-circuit programming of the STM8 Flash microcontroller on your application board via the SWIM protocol. Additional tools are to include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for programming your STM8.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.
